

### Prerequisites

Prior to the creation of Interpretation Rules, the following prerequisites must be met:

1. For an Interpretation Rule record to be created, information on Timesheet Calendars, Pay Codes, Allowances, Timesheet Activities, Leave Rules and Payee Leave Rules should be available.
2. Users must have access to create Interpretation Rule records using the Interpretation Rule Builder, as well as related Timesheet Calendars, Pay Codes, Allowances, Timesheet Activities and Leave Rules.

### Interpretation Rule Interface Appearance and Usability

- The Interpretation Rule Builder User Interface pages are Lightning Enabled and must only be used when the Salesforce Lightning Experience is active.
- All dates and times are displayed as per the location of the logged in User.
- The recommended browser is Chrome as per the Salesforce standard.
- The default display resolution supported for the Rate Calculation User Interface pages is 1920 x 1080 (1080p) scaled at 100%. The minimum display resolution supported is 1024 x 768 as per the Salesforce standard.
- The Interpretation Rule Builder User Interface pages will automatically resize in width and height so that the components are stretched appropriately depending on resolution.
- If the fields / tabs within the Interpretation Rule Builder User Interface pages are unclear or overlap, zoom out (or zoom in) through the web browser as needed.

### Definitions

Interpretation Rules are used to convert Timesheet Entries into Pay Transactions for payment of wages to Payees, taking into account various calculations for the amount of time worked. To familiarise yourself with these terms, please refer to the following definitions:

- **Breakpoints**

Breakpoints are created using the Interpretation Rule Builder UI, and are used during Timesheet Interpretation. They determine the Pay Codes to be applied to the Pay Transactions created for Timesheet Entries based on the conditions defined in the Interpretation Rule. Breakpoints must be created before the Interpretation Rule can be saved and finalised.

- **Daily Logic**

This is the default logic applied during Interpretation for Shift Start Time, Shift End Time and Hourly Interpretation Rules, unless Shift Logic is enabled. Daily Logic enables Timesheet Entries to be interpreted according to conditions of the calendar day they are entered on, and will assess each Timesheet Entry individually. Certain Interpretation Rule settings are not compatible with Daily Logic, and will only be applied during Interpretation if Shift Logic is enabled, including for Shift Allowance Breakpoints.

- **Interpretation Record Types**

There are five Interpretation Rule Record Types that may be used within the Interpretation Rule Builder to create Interpretation Rules that behave differently:

- **Daily Rates** - The Daily Rate Interpretation Rule allows Payees to be paid based on daily pay rates, calculated according to the amount of time entered in related Timesheet Entries for each day worked. Depending on the configuration in the Interpretation Rule, this can also be broken down into brackets for partial daily rates to be applied.
- **Hourly Rates** - The Hourly Rate Interpretation Rule allows Payees to be paid based on hourly rates, calculated according to the time of day captured in Timesheet Entries for each hour worked.
- **Interpretation Variation** - The Interpretation Variation Rule is used to amend the conditions for an existing Interpretation Rule, based on Timesheet Entries.
- **Shift Start Time** - The Shift Start Time Interpretation Rule allows Payee Pay Transactions to be created based on the time of day that a Timesheet Entry starts. Shift End Time Breakpoints may be conditionally applied alongside Shift Start Time Breakpoints, when Apply Shift End or Start Interpretation? is enabled.

- When Shift Start and End Time Interpretation is applied on a Shift Start Time Interpretation Rule, any Timesheet Entries that fall within both Shift Start and Shift End Breakpoints will be interpreted using the Shift End Time Pay Codes.
  - **Shift End Time** - The Shift Start Time Interpretation Rule allows Payee Pay Transactions to be created based on the time of day that a Timesheet Entry ends. Shift Start Time Breakpoints may be conditionally applied alongside Shift End Time Breakpoints, when Apply Shift End or Start Interpretation? is enabled.
    - When Shift Start and End Time Interpretation is applied on a Shift End Time Interpretation Rule, any Timesheet Entries that fall within both Shift Start and Shift End Breakpoints will be interpreted using the Shift Start Time Pay Codes.
- **Interpretation Rule Builder User Interface (UI)**

The Interpretation Rule Builder is the User Interface developed to enable the creation of Interpretation Rules for each Interpretation Record Type. The Interpretation Rule Builder consists of a series of dynamic fields, some of which are optional, and some of which differ based on the record type selected, to allow for the interpretation of various types of Awards and Agreements. The available fields within the Interpretation Rule Builder are grouped into several different sections, as listed below:

  - **Basic Information** - This section defines the system identifiers for the Interpretation Rule record.
  - **General Rule Settings** - This section defines the general features that may be enabled for the Interpretation Rule.
  - **Break Loading and Minimum Rest Rules** - This section defines how breaches in Rest Break calculations should be defined when creating Pay Transactions related to the Interpretation Rule.
  - **Split/Broken Shift and Sleepover Rules** - This section defines how Split/Broken Shift and Sleepover Timesheet Entries should be assessed and calculated when creating Pay Transactions related to the Interpretation Rule.
  - **Weekday, Saturday, Sunday and Public Holiday Rules** - These sections define the conditions for Weekday, Weekend and Public Holiday Breakpoints, and allow for defined Breakpoints to be populated in accordance with the Record Type and Interpretation Type selected.
  - **Frequency Hours Rules** - This section defines the maximum number of Ordinary hours an Employee can be paid within each Timesheet period, and the subsequent Pay Codes that apply once these defined maximums have been reached (i.e. Overtime).
  - **Allowance Rules** - This section defines the conditions that must be met before Allowance Pay Transactions will be created during Timesheet interpretation.
  - **Allowance Junction Rules** - This section defines Allowances that are associated with either a specific Leave Type or Timesheet Activity. Allowance Junction Rules may be applied to Hourly, Shift Start, Shift End or Custom Variation Interpretation record types.
  - **Leave Breakpoints** - This section defines the types of Leave Rules that could be included during Timesheet Interpretation of Leave Timesheet Entries. Leave Breakpoints will define the Pay Codes to be applied for each Leave Type available to Employees.
  - **Pay Code Caps** - This section defines the limitations that apply to Pay Codes across Breakpoints, ensuring any overlapping Breakpoints do not exceed the maximum number of Pay Code units per day or per calendar frequency.
- **Pay Transactions**

Pay Transactions detail the quantified units of Pay Codes from the Interpretation Rule, and the Pay Rate (and possibly Invoice Rate) as detailed in the Assignment Rate Records for those Pay Codes related to the Timesheet's Assignment. During Interpretation, Timesheet Entries are calculated and used to create Pay Transactions related to the original Timesheet Entries. Once created, Pay Transactions are ready for Payroll processing via Pay Batch Manager.
- **Project Codes**

Project Codes are used to define the different Pay Rates (and Invoice Rates) that should be applied to Pay Codes for tasks performed outside the defined scope of a role.
- **Shift Logic**

When applied to Hourly or Shift Interpretation Rules, Shift Logic enables multiple Timesheet Entries to be 'grouped' together for interpretation. This allows Timesheet Entries to be assessed

according to the conditions of the whole Shift, rather than the calendar day they occur on.

- When Shift Logic has been applied during Interpretation, the values populated for the following Timesheet Entry fields will determine whether or not individual Entries are grouped for assessment:
  - Shift Start Date
  - Shift Start Time
  - Shift End Date
  - Shift End Time
- These fields will be automatically populated on Timesheet Entries falling within the defined Split/Broken Shift periods, enabling Entries related to the same Shift period to be 'grouped' and assessed together.
- Timesheet Entries that do not fall within defined Split/Broken Shift periods will not be populated with any Shift Date/Time values, so that they may be assessed individually.
- Custom logic or integrations may be enabled in place of Split/Broken Shift settings to define Shift Logic, if required.
- In addition to this, some Interpretation functionality may only be applied when Shift Logic is enabled, such as Shift Allowance Breakpoints.

- **Timesheet Activity - Project Code**

Timesheet Activity Project Codes are used within Timesheet Entries to identify time that relates to a specific task detailed in an Interpretation Rule, which requires a different Pay Code or pay conditions for Interpretation.

- **Timesheet Entries**

Timesheet Entries are used to capture the times and hours of work completed by Payees during each Timesheet Period. Timesheet Entries are records of time or hours entered by a Payee during the Timesheet Period. These Entries may also include the following details, depending on the configuration of the Assignment record, Timesheet Calendar and related Interpretation Rule for the Payee:

- Start/End Times
- Total Hours/Total Minutes
- Break Times
- Paid Breaks
- Project Codes
- Timesheet Activities
- Leave Rules

Once Timesheets are Approved, the conditions defined in the related Interpretation Rule are used to create Pay Transactions related to the Timesheet Entries, so Payees are compensated in accordance with their entitlements in their Award, EBA, CA or other employment conditions.

- **Timesheet Frequency**

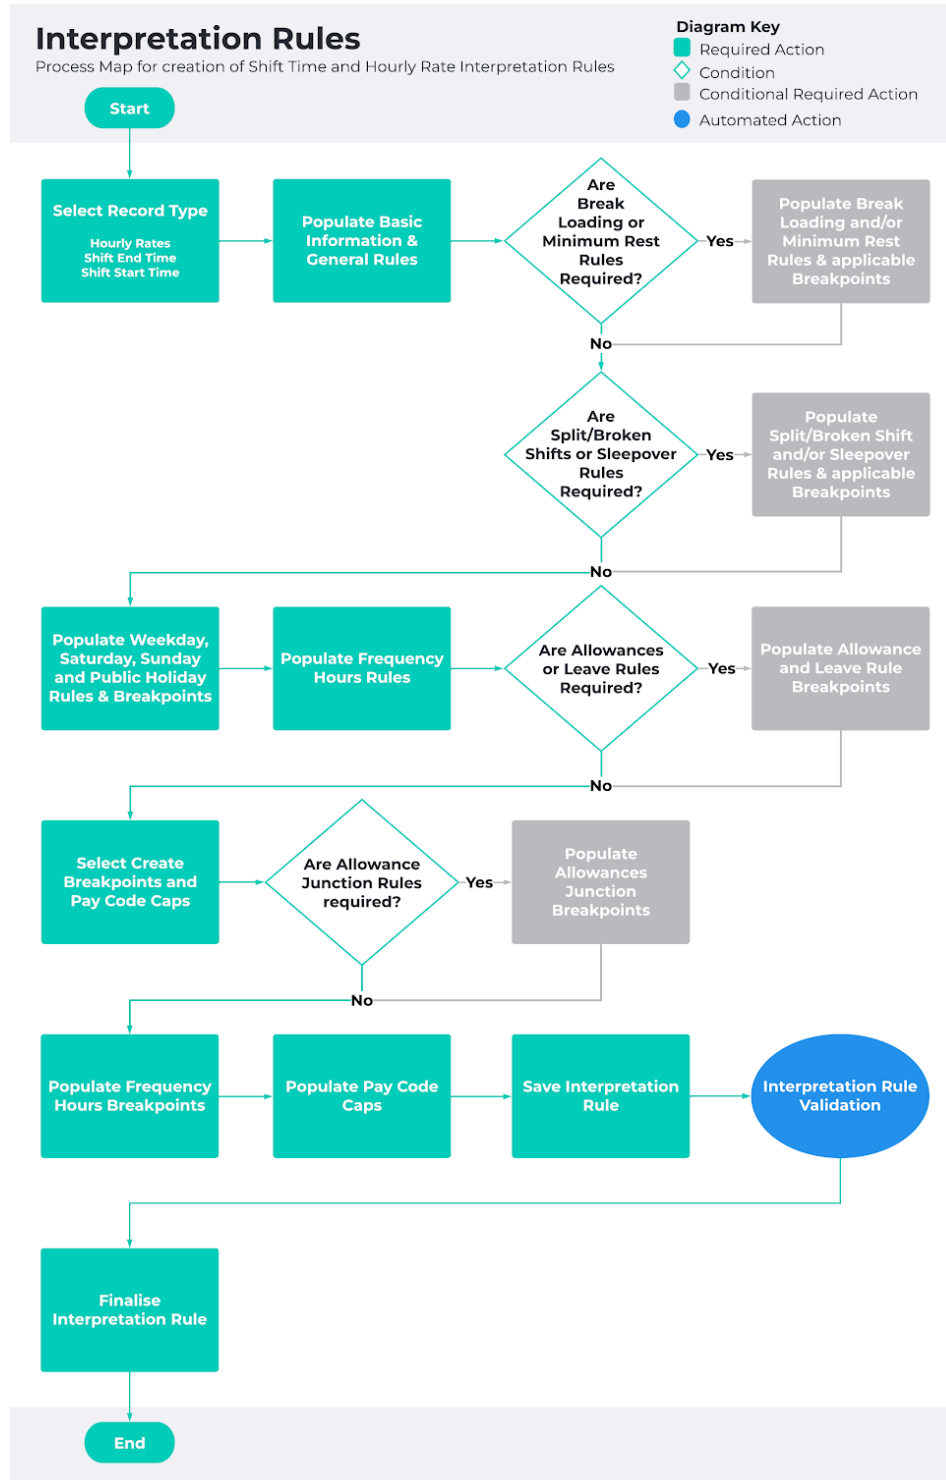

The Timesheet Frequency defines how often Timesheet Entries are split into individual Timesheets for Payees (i.e. Weekly, Fortnightly, Monthly, etc). The Timesheet Frequency defined on a Temp Assignment must match the Timesheet Frequency defined in the related Interpretation Rule for successful Interpretation to occur.

- The frequency of the Timesheet Calendar may differ from the Pay Schedule, which is different to the need for the Interpretation Frequency to match the Timesheet Calendar Frequency. For instance, the Pay Schedule might be Fortnightly, but Weekly Timesheets are submitted.

## General Overviews

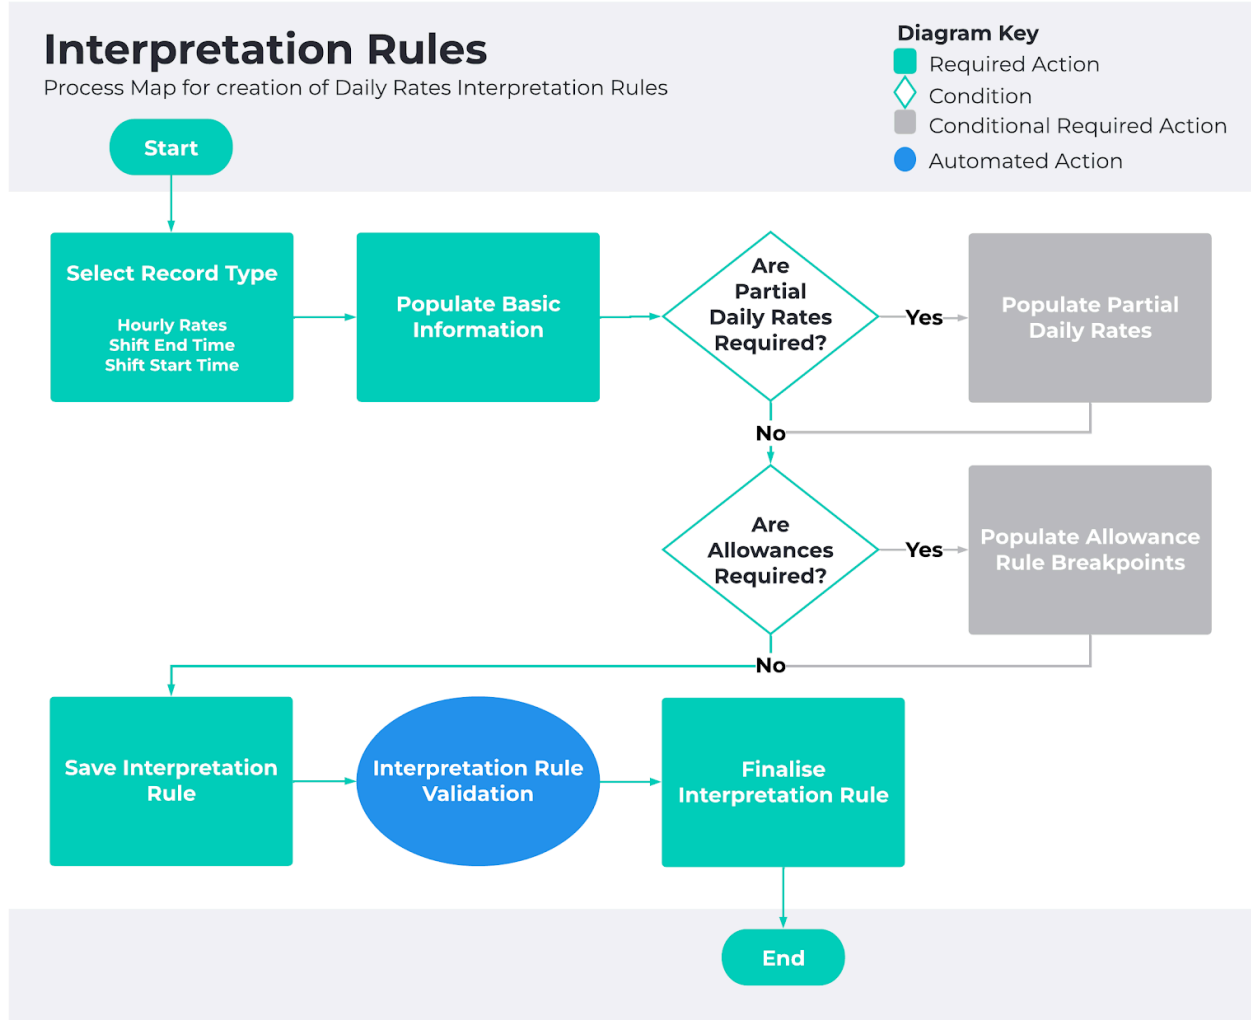

### QRG Interpretation Rule Builder - Shift Time and Hourly Rates

- Populate Hourly Rate Interpretation Rules
- Populate Shift Time Interpretation Rules
- Populate Break Loading & Minimum Rest Rules (optional)
- Populate Split/Broken Shift & Sleepover Rules (optional)
- Populate Allowance, Leave & Allowance Junction Rule Breakpoints (optional)
- Create Breakpoints & Pay Code Caps

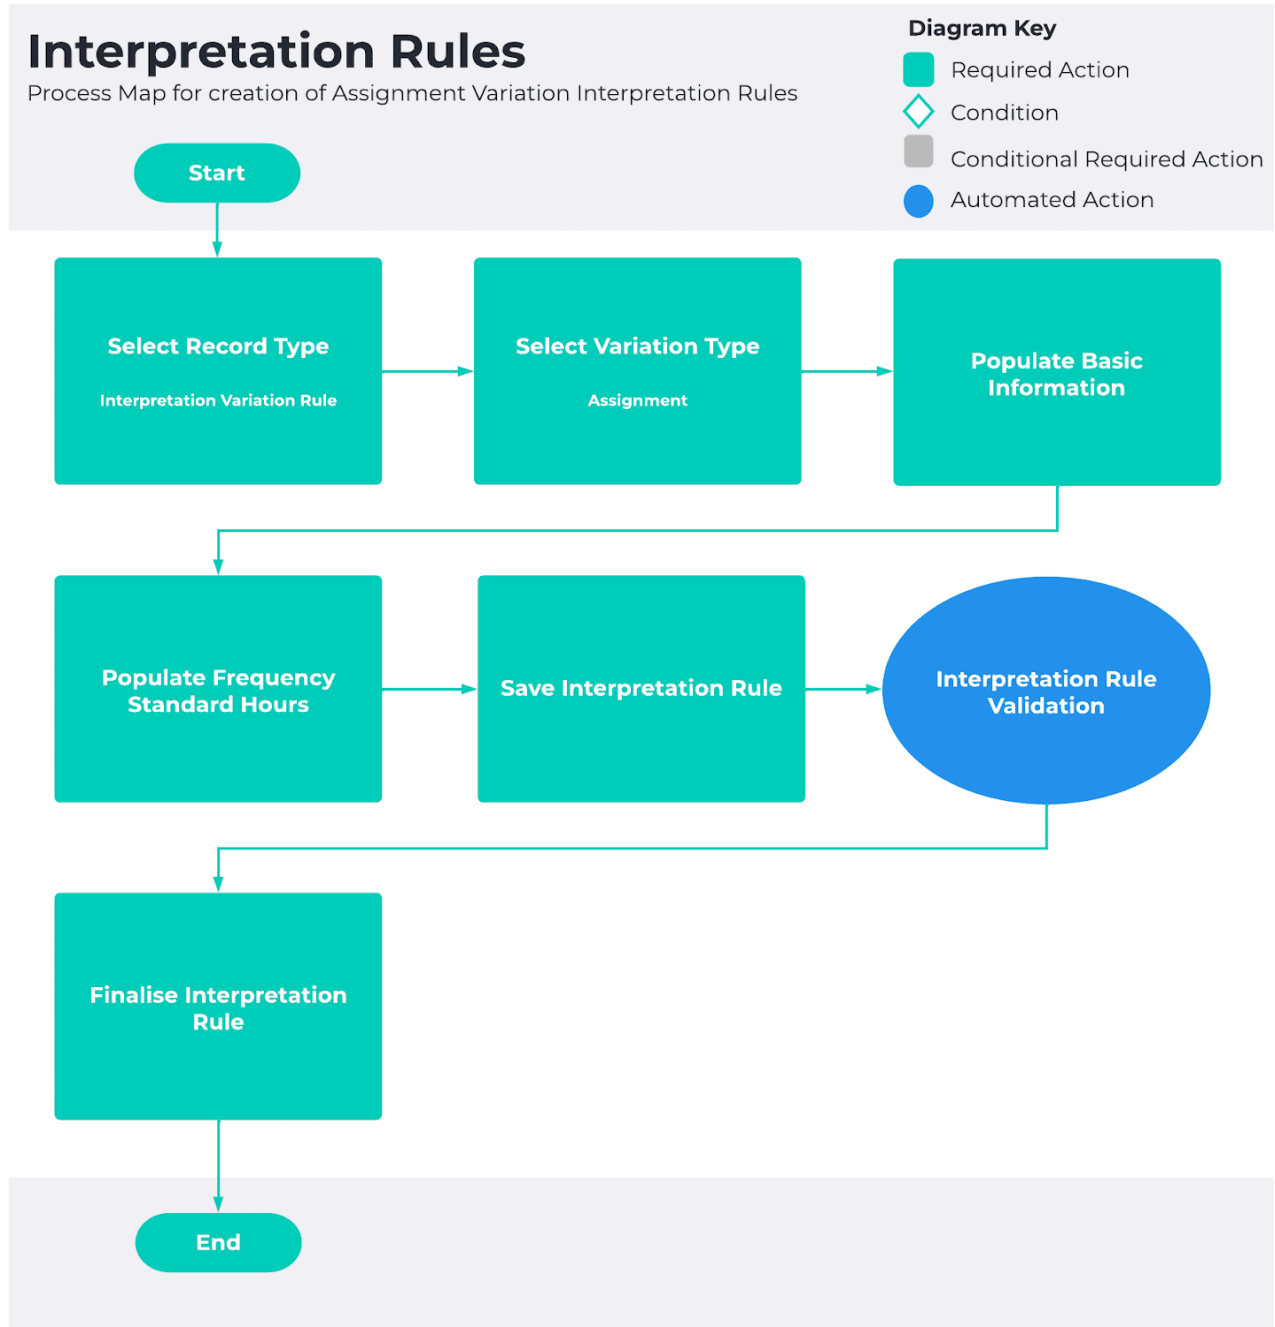

#### QRG Interpretation Rule Builder - Daily Rates

- Create Daily Rates Interpretation Rule

#### QRG Interpretation Rule Builder - Variation (Assignment)

- Create an Interpretation Variation (Assignment)

#### QRG Interpretation Rule Builder - Variation (Custom)

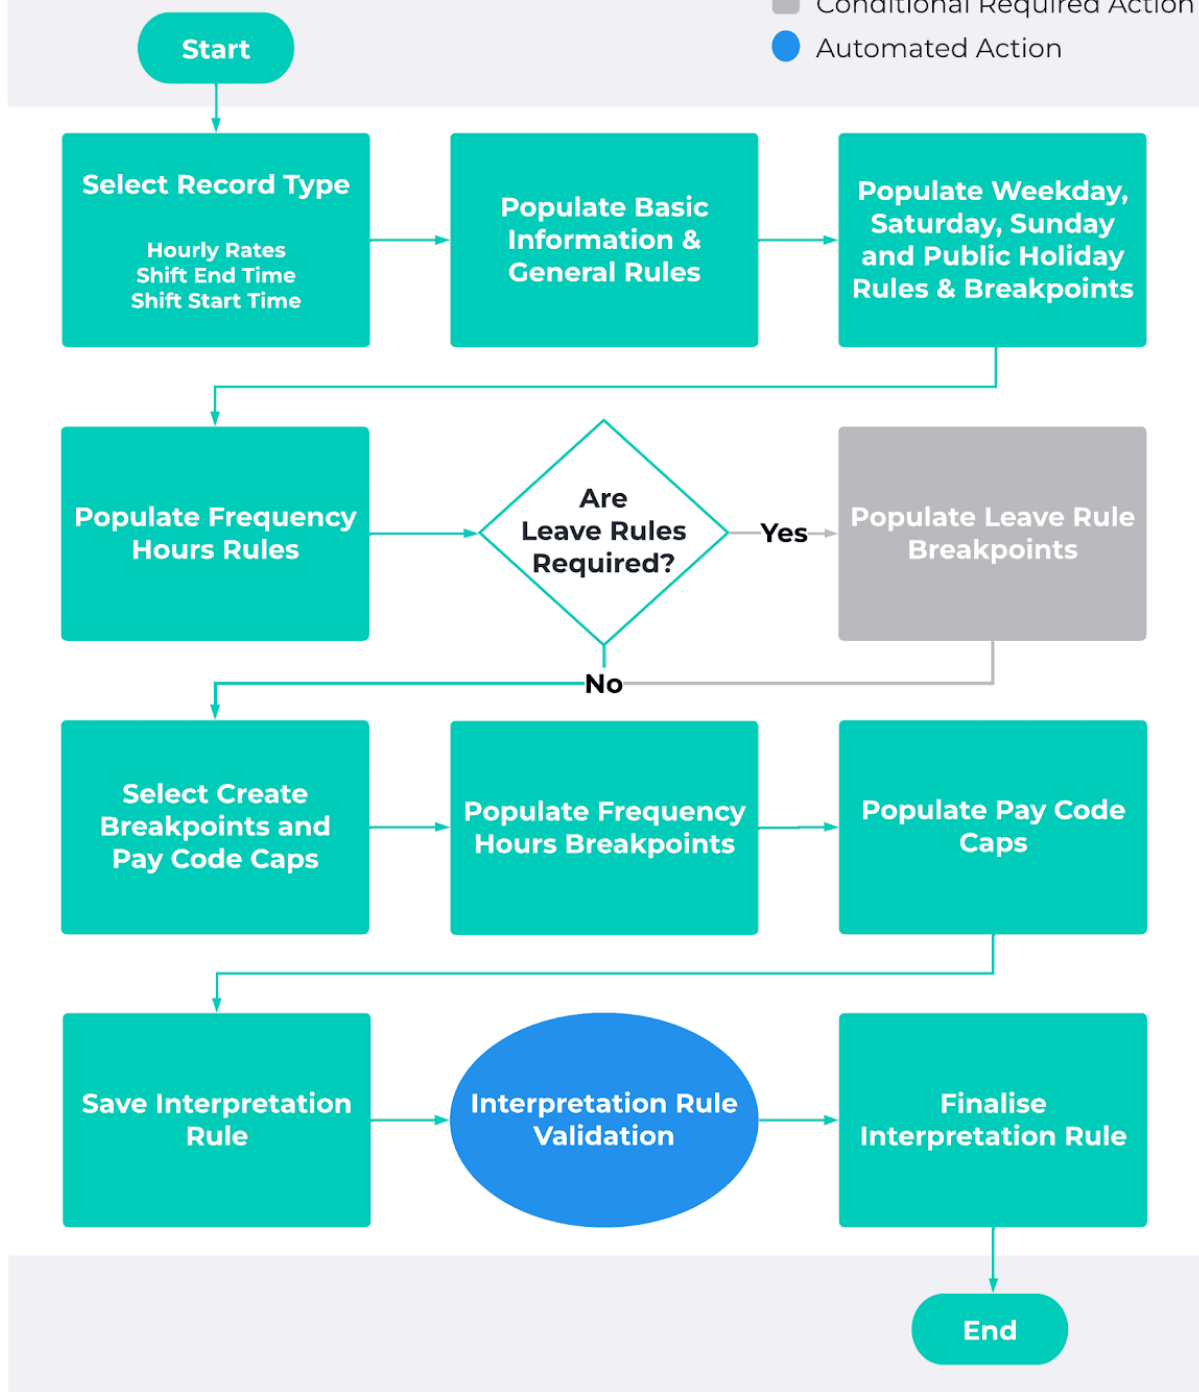

- Create an Interpretation Variation (Custom)
- Populate Allowance, Leave & Allowance Junction Rule Breakpoints (optional)
- Create Breakpoints & Pay Code Caps

## Interpretation Rules

Process Map for creation of Custom Variation  
Interpretation Rules
