

Purpose

The purpose of this Administrator Guide is to provide information about Validation Overrides. The intended audience for this document is System Administrators.

Validation Overrides

Overview

There are various standard validations within 2cloudnine Payroll to ensure adherence to data integrity, especially relevant when data is integrated with other third parties such as Superannuation Funds, the Australian Taxation Office (ATO), and online banking software.

There are, however, times when Users of 2cloudnine Payroll need customisations or some integrations. There may be a need to deactivate validations to enable data to be created and for processes to be completed as normal. To facilitate this, we have a Custom Setting within 2cloudnine Payroll to utilise when required.

Override TC9P Validation

There are several checkboxes in this Custom Setting that provide additional control over in-code validations performed on the related objects. By setting checkboxes to TRUE in this Custom Setting, you are turning off the in-code validation for that particular object. Any auto-populate triggers on that object will still fire, but the data validation will not.

It is recommended that you ensure the checkboxes in this Custom Setting are set to FALSE unless you need to turn off validation for some historic data to be entered, or other custom process requiring the validation to be disabled momentarily, with the understanding of reinstating the validations as determined by the Product Team. To locate the Validation Override Custom Settings:

Go to **Setup > Custom Settings > select Manage next to Override TC9P Validation**

1. Select **Edit** at the top of the main window (see Figure 1).
2. Select the various checkboxes of the Object that requires the current Product Validations to be momentarily deactivated.
3. Select the **Save** button.
4. Users should immediately proceed with the process, which requires this validation to be turned off.
5. Once the process is complete, Users must return to **Setup > Custom Settings > select Manage next to Override TC9P Validation**.
6. Select **Edit** at the top of the main window.
7. Deselect all the checkboxes to ensure the Product Validations are turned back on.
8. Select the **Save** button.

Important Notes

(Figure 1)

You must NEVER share this information with Clients. If they are aware of this, they can potentially activate this without our knowledge, therefore will have issues later with software not processing as required due to the overrides being active, as well as not complying with other legislative agencies and integrations.

Figure 1

Custom Setting
Override TC9P Validation

If the custom setting is a list, click **New** to add a new set of data. For example, if your application had a setting for country codes, each set might include the country's name and dialing code.

If the custom setting is a hierarchy, you can add data for the user, profile, or organization level. For example, you may want different values to display depending on whether a specific user is running the app, a specific profile, or just a general user.

Important Notes

(Figure 1)

If an Org has the Scheduled Job 'Automatic Status Update' running each night, this job will also perform the additional task of reviewing any of these checkboxes that are ticked in Figure 1 for Validation Overrides, and will uncheck them so all validations will resume to launch as per the standard Product design.
